Python String join() Method

‹ String Methods

Example

Get your own Python Server

Join all items in a tuple into a string, using a hash character as separator:

```python
myTuple = ("John", "Peter", "Vicky")

x = "#".join(myTuple)

print(x)
```

Try it Yourself »

Definition and Usage

The `join()` method takes all items in an iterable and joins them into one string.

A string must be specified as the separator.

Syntax

```
string.join(iterable)
```

Parameter Values

Parameter	Description

More Examples

Example

Join all items in a dictionary into a string, using the word "TEST" as separator:
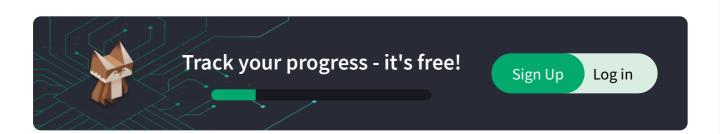

```python
myDict = {"name": "John", "country": "Norway"}
mySeparator = "TEST"

x = mySeparator.join(myDict)

print(x)
```

Try it Yourself »

Note: When using a dictionary as an iterable, the returned values are the keys, not the values.
